

Company Information and Overview

Generated: March 18, 2026

COMPANY OVERVIEW

Control AI is a technology company focused on revolutionizing human-computer interaction through artificial intelligence. The company's flagship product, Control, represents a fundamental shift in how users interact with computers—moving from manual interface navigation to natural language-driven automation.

Founded by Okorie Greatness in Lagos, Nigeria, Control AI is building the 'Action Layer' for the desktop—a universal interface that translates human intent into precise computer actions. The company's mission is to eliminate the 'Software Mastery Barrier' that prevents billions of users from fully utilizing the capabilities of modern software.

Core Product: Control

Control is a universal AI agent that operates any desktop application or system-level setting exactly like a human would. It uses computer vision to 'see' pixels and graphical interfaces, allowing users to execute complex multi-app workflows using only natural language voice or text commands.

Key Differentiators

- **Universal UI Logic:** Instead of relying on brittle APIs or plugins, Control parses screen pixels to identify buttons, sliders, and menus in real-time. This allows it to drive any software, from specialized tools like AutoCAD to general system settings.
- **Hybrid Action Engine:** Local execution engine for 0ms latency in mouse/keyboard actions, paired with high-reasoning Cloud APIs for visual understanding.
- **Zero-Knowledge Mastery:** Removes the Software Mastery barrier. A beginner can perform expert-level tasks in complex software simply by describing their intent.
- **Cross-App Automation:** Users can chain actions together that the OS currently cannot, such as automated file organization across multiple applications.
- **Local-First Architecture:** Minimizes infrastructure costs and maximizes privacy by leveraging user's own compute for interface rendering.

Product Components

Control consists of two integrated components:

- **Desktop Application (Electron):** The primary interface for local computer automation. Features voice control with 'Hey Control' wake word detection, visual AI for screen understanding, and comprehensive mouse/keyboard automation. Supports macOS, Windows, and Linux.
- **Web Platform (Next.js + FastAPI):** Cloud infrastructure for virtual machine management with remote desktop capabilities. Enables users to provision VMs with AI automation agents, access them via browser-based VNC streaming, and run automation in the cloud.

PROBLEM STATEMENT

Modern software has become incredibly powerful, but also incredibly complex. This creates a fundamental problem: the gap between what software can do and what users can accomplish.

The Software Mastery Barrier

- Users spend 40% of their workday performing 'digital manual labor'—clicking through nested menus and managing file systems.
- Professional software like Blender, AutoCAD, or Adobe Premiere requires hundreds of hours of training to use effectively.
- Billions of knowledge workers are 'locked out' of powerful tools because they don't have time for a 100-hour learning curve.
- Creativity is 'killed' by complex UIs—users spend more time fighting interfaces than expressing their ideas.
- Current AI assistants are trapped in chat boxes—they cannot interact with actual software or automate real workflows.

Market Impact

This problem affects multiple segments:

- **30M+ Professional Creatives:** 3D artists, video editors, and designers who struggle with complex interfaces.
- **1B+ Knowledge Workers:** Office workers who could benefit from automation but lack programming skills.
- **Emerging Markets:** Users in developing economies who need professional capabilities without extensive training.
- **Aging Population:** Seniors who want to stay digitally connected but face cognitive barriers to new software.

HOW CONTROL FUNCTIONS

Technical Architecture

Control's architecture is designed for universal compatibility and minimal latency:

- **Visual Perception Layer:** Captures screenshots with cursor position marking. Uses AI to identify UI elements (buttons, menus, text fields) through pixel analysis rather than accessibility APIs.
- **Reasoning Engine:** Processes user intent through large language models with visual understanding capabilities. Currently supports Google Gemini, Anthropic Claude, OpenAI GPT-4, DeepSeek, and local models via Ollama.
- **Execution Layer:** Translates AI decisions into precise mouse and keyboard actions using @computer-use/nut-js. Implements human-like movement curves for applications sensitive to automation.
- **Coordination System:** Maps screen positions to a 1000x1000 normalized coordinate grid for consistent targeting across different screen resolutions.
- **Voice Pipeline:** Wake word detection via Picovoice Porcupine, speech-to-text via Vosk server, text-to-speech via Edge TTS.

User Interaction Flow

The typical user interaction with Control follows this flow:

- **1. Activation:** User says 'Hey Control' or presses a keyboard shortcut to activate the assistant.
- **2. Input:** User describes their intent in natural language, e.g., 'Make this 3D cube look like brushed aluminum and render it.'
- **3. Visual Analysis:** Control captures the screen and identifies the current application context.
- **4. Planning:** AI determines the sequence of actions needed to accomplish the task.
- **5. Execution:** Control performs mouse clicks, keyboard inputs, and menu navigation to execute the plan.
- **6. Verification:** System verifies completion and reports results to the user via voice or text.

LEADERSHIP TEAM

Okorie Greatness - Founder, CEO & CTO

Okorie Greatness serves as both Chief Executive Officer and Chief Technology Officer, responsible for product vision, technical architecture, and company strategy.

- Currently studying Computer Science at Bells University of Technology, Nigeria.
- Built the core Control software since late 2024 (originally as Aura Assistant).
- Previous projects include BellsAttend+ (geofenced attendance system), Index (software discovery tool), and Aura AI (AI companion).
- Demonstrated entrepreneurial acumen through a successful dropshipping arbitrage business with innovative '7-7-70' guarantee model.
- Full-time commitment to Control with 50+ hours weekly dedicated to development and growth.

CEO Responsibilities

- Setting company vision and strategic direction
- Building and leading the executive team
- Fundraising and investor relations
- Representing the company to partners and media
- Driving product roadmap and market positioning

CTO Responsibilities

- Technical architecture and platform design
- AI/ML strategy and model selection
- Engineering team leadership and hiring
- Technology partnerships and integrations
- Security and infrastructure oversight

[Brother's Name] - Chief Marketing Officer & Chief Operating Officer

The founder's brother is planned to assume dual roles as CMO and COO, bringing expertise in consumer utility and user experience design.

CMO Responsibilities

- Brand strategy and positioning
- Marketing campaigns and customer acquisition
- Content strategy and thought leadership
- Community building and user engagement
- Market research and competitive analysis

COO Responsibilities

- Day-to-day operations management
- Process optimization and efficiency
- Customer success and support
- Partnership management and business development
- Financial operations and budgeting

BUSINESS MODEL

Revenue Model

Control AI employs a tiered subscription model with usage-based pricing for high-reasoning tasks:

Tier	Price	Target User	Features
Free/Entry	\$10-20/month	Casual users, beginners	Desktop agent, basic Action Credits
Professional	\$50-60/month	Full-time creatives, engineers	Unlimited local actions, high cloud credits
Enterprise/Teams	\$150+/seat	Studios, architecture firms	Workflow Libraries, enhanced security
Usage Upsell	\$5-10/pack	All tiers	Additional Action Credits

Competitive Advantage

The local-first architecture provides significant cost advantages:

- Users provide their own compute for interface rendering, dramatically reducing infrastructure costs compared to cloud-only competitors.
- API costs are only triggered during active 'Act' sessions, not for idle time.
- Privacy-focused architecture attracts enterprise customers concerned about data security.
- Cross-platform compatibility eliminates vendor lock-in for customers.

MARKET OPPORTUNITY

Target Markets

Control AI's go-to-market strategy focuses on a 'wedge' into the professional creative market before expanding to broader audiences:

- **Initial Wedge: Professional Creatives (30M+ users):** 3D artists, video editors, CAD engineers who have the highest pain point due to complex software.
- **Secondary Market: Knowledge Workers (1B+ users):** Office workers seeking automation without programming expertise.
- **Enterprise Market: Studios and Firms:** Architecture firms, VFX studios, engineering companies with team-wide automation needs.
- **Consumer Market: Tech-Enthusiasts:** Early adopters interested in AI-powered productivity tools.

Revenue Projections

The company targets significant market share capture:

- By capturing 1% of the global professional workforce at an average of \$30/month, the company projects \$3.6 Billion in Annual Recurring Revenue (ARR).
- **Total Addressable Market:** Aiming to capture significant portion of the \$920B+ global software market (2026 estimate).
- The product is positioned not just as an app, but as a new way people interact with computers.

Competitive Landscape

- **Big Tech OS-Level Agents:** Microsoft Copilot/Recall, Apple Intelligence. Limited by 'walled gardens' and platform restrictions.
- **Browser/Cloud Agents:** OpenAI Operator, Anthropic Computer Use. High latency and privacy concerns for professional work.
- **Open Source Agents:** OpenClaw, Simular. Require technical setup, lack polished user interfaces.
- **Legacy RPA:** UiPath, Automation Anywhere. Expensive, brittle, require programming rather than natural language.

Key Insight

Competitors focus on 'general' tasks like booking flights or summarizing emails. Control AI understands that the real value is in abstracting complex software interfaces. The insight is that people don't want an 'assistant' to talk to; they want a 'driver' for their professional tools.

COMPANY VISION

Mission Statement

To turn every computer user into a power user, making software expertise obsolete through an agent that acts as a human-like driver for your operating system.

Long-Term Vision

Control is not just an application—it is the new way people interact with computers. The vision extends beyond desktop automation to becoming the universal interface layer between human intent and machine capability across all platforms and devices.

Strategic Goals

- **Short-term (0-12 months):** Achieve product-market fit with professional creatives, launch public beta, establish initial revenue streams.
- **Medium-term (1-3 years):** Expand to enterprise market, develop industry-specific modules, build workflow marketplace ecosystem.
- **Long-term (3-5 years):** Become the standard interface layer for human-computer interaction, expand to mobile and emerging platforms, achieve global market penetration.

Location Strategy

The company plans to establish presence in key technology hubs:

- **San Francisco:** Primary headquarters for YC batch and immediate scale. Proximity to OpenAI, Anthropic, and YC AI founders provides technical advantages and access to engineering talent.
- **Los Angeles:** Secondary presence for proximity to early adopters in 3D animation, VFX, and architectural studios. Enables tight feedback loops with demanding users.
- **Lagos:** Continuing operations and development presence, leveraging cost advantages and local talent.

COMPANY INFORMATION SUMMARY

Attribute	Details
Company Name	Control AI
Product Name	Control
Founded	2024
Founder/CEO/CTO	Okorie Greatness
Planned CMO/COO	[Brother's Name]

Headquarters	Lagos, Nigeria / San Francisco, USA (planned)
Industry	AI / Desktop Automation
Target Market	Professional creatives, knowledge workers, enterprises
Business Model	Tiered SaaS subscription with usage-based pricing
Key Technology	Computer vision, LLM integration, voice control
